Abstract (en)
The BUSBAR-FUSELINK ELEMENT proposed is formed with a metal element which through a series of operations of punching and folding is provided with an upper flat surface from which emerge perpendicularly or in another direction a series of branches, which number and nature will be a function of the special characteristics of the printed circuit board where it is applied. Afterwards, said connection, and by an overmolding operation or the like, will be covered with a sheath which at the same time that gives an electric protection will rigidify the connection. Later will be made the final adjustment of the connection zone (FUSELINK) by a second punching. <IMAGE>
