Abstract (en)

[origin: WO9841405A1] The object of the present invention is a follow-up arrangement comprising recording means as well as base means annexed thereto and having target fields (10) adapted for separate elements (13b, 13c). Said separate elements (13b, 13c) are included in a basic set of possible elements describing an event which is the object of the follow-up procedure. Said basic set constitutes a part which is pre-integrated in the arrangement, from which part each element (13b, 13c) can be chosen and annexed to an appropriate target field (10) according to external discriminative stimuli triggered by an event which is followed up. A method for the realization of a follow-up arrangement for a series of events is also an object of the present invention, wherein base means which generally describe an event are formed prior to the realization of a series of such events, as well as a basic group of elements (13b, 13c) describing possible separate features of said event. A further object of the invention is the use of folder means, intermediate means arranged therewithin as well as separate elements (13b, 13c) detachable from loose leafs in accordance with the principles presented above.
