Abstract (en)

The catalyst is bifunctional and have a high cracking activity and acidity. The composition gives good flexibility of operation of the hydrocracking reaction at various temperatures and pressures. The catalyst comprises an oxide-type amorphous, or poorly crystallized, matrix, a group VB element, a zeolite Y (non-dealuminized) of lattice parameter greater than 2.438 nm and SiO<sub>2</sub> / Al<sub>2</sub>O<sub>3</sub> (global) less than 8, with a promoter element chosen from boron, phosphorus or silicon. An Independent claim is also included for the preparation of the catalyst comprising: (a) weighing and drying a precursor solid which comprises a matrix, zeolite Y, a promoter (boron, phosphorus or silicon compounds), a group VIB or VIII compound and a group VIIA element, with the mixture formed by extrusion, pastillating, etc. (b) calcining the dry solid obtained above 150 degrees C; (c) dry impregnating the solid precursor with a group VB element, preferably niobium; (d) leaving the moist solid in a moist atmosphere at 10-120 degrees C; (e) drying the solid at 60-150 degrees C; and (f) calcining the dried solid at greater than or equal to 250 degrees C.
