Abstract (en)  
[origin: EP0967027A2] A steel profile with maximum and minimum local cross sectional temperatures is clamped and cooled down. As a consequence of clamping, the lower limit temperature produces a thermal dilatation in all profile fibers which is greater than the dilatation which would be required for fiber plasticizing of the non clamped profile with the highest compressive residual stresses. A steel profile (1) with maximum and minimum local cross-sectional temperatures respectively below the Ar1 point and above a lower limit temperature  $\theta_u$  is clamped at its ends (1a, 1b) and is cooled down. As a consequence of clamping, the lower limit temperature  $\theta_u$  produces a thermal dilatation in all profile fibers which is greater than the dilatation which would be required for fiber plasticizing of the non clamped profile with the highest compressive residual stresses.
