Abstract (en)

[origin: EP0967030A2] Each roller (4) to be adjusted is individually identified, set in an adjusted relative position, and coupled to its adjusting mechanism (5). After coupling, the position of the roller is determined, and it is adjusted to a position relative to a previously calculated end position, and/or a position dependent upon the wire to be straightened, its dimensions and the straightening process. The adjusting mechanism has a roller setter (2) and a releasable coupling (3) between the setter and the adjusting mechanism of a straightening roller.
