Abstract (en)

[origin: EP0967164A1] The conveying speed of a printed product (3) lifted off a stack is initially raised relative to the rotating speed of the conveying drum (6), and is reduced in front of the hand-over point, respectively within the contact area of the opening device, so that the printed product is stopped or moved backwards relative to the drum circumference. The product is positioned contact-free on the drum circumference.
