Abstract (en)  
[origin: EP0967333A1] The wall consists of groups of front elements (1) anchored via traction elements (5,6) in a filler material. Preferably, plastically deformable compression support elements (4) are positioned between groups of front elements. When a pre-determinable pressure in vertical direction occurs, the support elements are reduced in height, corresponding to the compression of the filler material (11) during wall construction. Each front element in a group is supported on two support elements, which in turn are supported on the elements in the group below.
