Abstract (en)

[origin: EP0967349A2] The locking device includes a rotating trap (1) which locks or releases a locking bolt, and a pawl (4) which locks the rotating trap in position. The pawl is driven by a positioning drive (10) to release the rotating trap in an aperture position of the element. Devices control the positioning drive in such way, that it is led back from an operating position into a rest position after a release of the rotating trap. The positioning drive is controlled by pulse width modulation.
