Abstract (en)  
The screen controller includes an animation circuit (50) which receives commands from a decoder (30) and modifies and moves blocks of points in the screen memory (34). Access to the screen memory (34) and a buffer memory (52) is controlled by an access manager (54) directed from the decoder (30). A double access circuit (58) controls traffic between a multiplexer (56), the memories (34,52) and a latch register (39)
