Abstract (en)

[origin: EP0967747A2] A tuner 101 receives broadcast data from a broadcasting station 109 and forwards RDI (Receiver Data Interface) data, including multimedia data, to a data decoder 102. The data decoder 102 decodes the data into MOT data according to a given protocol. A file manager 103 identifies files according to IDs generated by a file system 104, and produces a timer monitoring table from information such as a trigger time written in a MOT header. The file system 104 stores files in a storage unit 105 and produces a directory information table in which file display availability statuses and display order are recorded for files with the same name. A data browser 108 receives display instructions from a user and displays, in order, multimedia data that is recorded in the directory information table as being available for display. <IMAGE>
