Abstract (en)

[origin: CA2285464A1] The invention relates to a swing arm for moveably fitting wheels onto a support element, characterised in that it has at least two hollow arm parts (12, 14), hollow-moulded using the internal high pressure moulding method, optionally with variable cross-sections. One of said arm parts has a connecting projection which is inserted into and fixed in the end section of the other arm. The exterior diameter of the projection corresponds to the interior cross-section of the other arm part so that the arm part can be placed thereon.
