Abstract (en)

[origin: DE19632258C1] The invention is based on the use of the services of a message handling system which in turn is based on the services of a transport system which directly drives the information transmission devices which convert information into an appropriate format for the transmission path of interest, so that thanks to the transmission of protocols the user requests are automatically processed and the available communication means are automatically driven. Only a fully functional peer-to-peer protocol is used, without any reversal of the information flow. Instead of an acknowledgement sent back by the receiving user, an internal acknowledgement is generated by the transport system of the user who sends out the information. The disclosed message handling system (MHS) is particularly suitable for high performance and fast data communication, especially of relatively short messages in a radio network.
