Abstract (en)

[origin: WO9831179A1] The invention relates to a procedure for setting up a call in a wireless local loop (WLL) based on mobile communication technology, in which subscriber's stations (MS) are connected via a radio link to an access node (AN) and from the access node to a local exchange (LE) in a wired network. To achieve faster call setup, the message-based dialling information consistent with mobile communication specifications sent by a subscriber's station (MS) is converted in the access node (AN) into message-based dialling information consistent with the signalling used in the interface between the local exchange and the access node, and this information is transmitted to the local exchange.
