Abstract (en)

[origin: WO9729865A1] An apparatus is disclosed for the electrokinetic removal of metals, said apparatus having a built-in positive or negative electrode which is surrounded by a first circulation system demarcated with a charge-selective membrane (12) which transfers ions with the same charge as the electrode (2), said first circulation system being separated from a second circulation system with a charge-selective membrane (12) arranged for accumulation, and which in turn is demarcated with yet a further charge-selective membrane (13) which transfers ions with a charge opposite to that of the electrode (2). The apparatus has a spear (16) which is built up around a pressure-stable core of plastic (9) and contributes towards the distribution of circulation liquids (8 and 10), and the spear (16) tapers down towards that end which faces downwards in the medium.
