Abstract (en)

[origin: FR2761329A1] The invention concerns a method for controlling a motor vehicle power steering, consisting of an electropump unit (9) electronically controlled and comprising a hydraulic circuit with flexible pipes (5), such that, during a transitory phase, when the steering is stressed and the unit (9) serviceable voltage ( $U_m$ ) shifts from a stand-by value ( $U_{min}$ ) to a maximum value ( $U_{max}$ ), and when the pipes (5) are inflated this serviceable voltage ( $U_m$ ) whether progressively or not decreases to an optimal value ( $U_{op}$ ) providing the steering power up to a maximum speed threshold (OMEGA 1) of the motor vehicle steering wheel, before resuming its stand-by value ( $U_{min}$ ) when the vehicle is no longer stressed.
