Abstract (en)
[origin: EP0970678A2] The sick-room bed, to move the patient into a variety of positions, has a frame and a linkage lifting mechanism with coupled links (6,7). The linkage is operated by a drive with two drive sections (21,22). The mattress support (14) is held by the carriers (10,11) of the lifting linkage system at two lateral and horizontal displaced axes (12,13) at the head and foot ends of the bed, to be moved between extreme top and bottom positions. In the bottom position, the carriers (10,11) extend over the frame. In all movement combinations, the mattress support (14) is held away from the frame.
