Abstract (en)

[origin: EP0972907A2] A foam part (3) which has a hollow profiled section (6) with slit (7) on the wall side, has a closure (8) which counteracts the slit from spreading open. The closure is formed by a closing part held on the foam part and/or on the ladder beam. The foam part is preferably formed as a square block with rectangular section contour. The closing part may be hook-and-loop fastener strip integrated in the opposing separating faces in the slit area or is formed by interlocking tension parts.
