Abstract (en)

[origin: EP0973301A2] The local information network has a number of network nodes (0-7) coupled together via at least 2 ring circuits, one of the network nodes acting as a master node for each ring circuit for erasing the circulated information when it is fed back. Each network node responds to a defect along a ring line for providing a signal indicating its location to each of the other nodes, with a bypass loop (79) provided for the transmission line at the defect location node and the master node disconnecting the master function for the ring line with the defect. An INDEPENDENT CLAIM for network nodes for a local information network is also included.
