Abstract (en)
[origin: US5947016A] A garlic cutter comprising a housing bearing a cutting blade (8) at its underside and further comprising an upper part (2) with a punch (12) affixed thereto. The upper part when in the operational state and during rotation relative to the housing (6) carries out an axial displacement relative to the co-rotating cutting grid (5b). In order to achieve speed in operation following filling of the garlic cutter, so that the latter gently mince the fruit and also be rapidly reopenable and cleanable, an inner structure (7) receiving the garlic is rotatably supported in the housing (6) and comprises a cutting grid (5b) entered by the punch (12) mounted to a spindle (4). A coupling nut (3) can be mounted on the housing (6), that in the operational state assure engagement with the spindle (4) and that in the open state allows longitudinal displacement of the spindle (4).
