Abstract (en)
[origin: EP0976505A2] The hand drill has a second hammer mechanism (20) arranged inside the housing (2), for the production of axial hammer action, with the hammer action having an axial power and hammer action frequency, which is at least partially different from that of the first hammer mechanism (16) action. The drill or the chisel tool bit (7) clamped in the chuck (6) is selectively rotationally drivable from the first (16) or from the second (20) hammer mechanism or can be acted on from both hammer action mechanisms together axially, or without axial hammer action support.
