Abstract (en)

[origin: WO9942687A1] An electrically controlled lock for a safe has a magnetic lever (10) which can be supported on an electrically excitable holding magnet (14) and moved by external forces, as well as a door bearing a closing hook (1) which enters the lock housed in the safe case (2) and is retained therein by a locking device. The object of the invention is to reduce the number of parts and simplify the operation of the lock. For that purpose, a stopper (3) provided with a locking block (7), coupled to the magnetic lever (10) and moved by a control cam (8) which lies in the path of the closing hook (1) acts as a door closer.
