Abstract (en)  
[origin: EP0978323A2] The inside of the tubular body (3) has stops (5,6) for engaging in the bearings of the roller handle. The stops have at least one protrusion which interacts with a stop flank around the bearings. One or more stop elements are each only partly formed over the circumference of the inside wall of the tubular body and are dimensioned so that their shape can be defined by mandrel elements which can be drawn axially out of the opposite end sides of the tubular body.
