Abstract (en)

[origin: WO9849067A1] Known containers are designed according to the rotary stack principle and have conical side walls. This conical form reduces volume as well as load-bearing and carrying capacity. The invention relates to a storage and transport container which has support feet (6, 7) and support grooves (9, 10), and detent springs (8) and detent grooves (13, 14, 15) which are arranged specifically on the side walls so that they correspond with each other. As a result, two identical containers can be stacked inside each other in one direction and on top of each other in the other direction, and two smaller containers can be stacked with a larger container in any direction.
