Abstract (en)
[origin: WO9850299A1] The invention relates to a cable-driven elevator whose driving disk (16) is fitted at the highest or lowest stopping place of the cage, in the space between the cage side wall or its upper travel path and the adjacent shaft side wall (14). The motor (60), including its braking device, is fitted in an area accessible from the stopping place landing, near the shaft door opening or laterally above this. A transmission device (30, 66) between the driving disk and the motor is guided through the space between the shaft side wall (14) and the open position of the cage door and shaft door.
