Abstract (en)

[origin: WO9849401A2] Arrangement and apparatus for soil air monitoring, paving sealing examination and soil air extraction with regard to the soil (25) under a liquid-tight and/or gas-tight floor (27) of a location, in particular for examining the degree of liquid-tightness of such floor (27). The arrangement comprises soil air monitoring units (15), which extend from the floor surface (28) into the soil (25), which units are positioned in such a manner that their operational area preferably comprises the soil (25) under the entire floor (27), but at least those parts of the soil (25) under or in the direct vicinity of parts of the floor (27) where there is a specific risk of contaminated substances penetrating from the floor (27) into the soil (25). The interface between the floor surface (28) and a soil air monitoring unit (15) is fluid-tight, and the soil air monitoring units (15) are individually accessible from the floor surface (28) via a closable opening (41).
