Abstract (en)
[origin: WO9851964A1] Disclosed is a continuous two-feed steam generator comprised of a first vertical feed gas pipe (4) with an gas up-flow hot gas tube. The inventive apparatus is characterized in that the back wall (7) of the combustion chamber is inclined inwards to form, together with the bottom (12) of the immediately contiguous horizontal feed gas pipe, a nose engaging into the combustion chamber (8). Some manifolds (9C) in the lower part (14) of the steam generator rear wall extend upwards with no inclination owing to their support function, up to a support structure (5) located outside the hot gas pipe.
