Abstract (en)

[origin: EP0980928A2] To control the pressure of a mangle, using two mangle rollers (1,2), the gap (11) between the roller axes (13,14) is adjusted immediately to alter the pressure without hysteresis and in the event of an emergency stoppage. The gap (11) between the roller axes (13,14) is measured by a path movement monitor or increments of the rotations of a lifting spindle (12) or the like. The gap (11) between the roller axes (13,14) is set by mechanical lifting gearing or a threaded spindle (12).
