Abstract (en)

[origin: EP0981028A1] The exhaust air is subjected to an increase in pressure for condensing and then introduced into a fluidized bath (13), preferably via a filter (17) such as a sintered metal filter. Fresh liquid is supplied continuously or discontinuously to the fluidized bath and fluid is discharged from the bath. The energy introduced into the bath through the exhaust air can be drawn off at least in part.
