Abstract (en)

[origin: EP0982468A1] The invention relates to a method for wrapping a cable around a pipe construction, in particular a method for wrapping an umbilical around a flow line such as flexible or a rigid riser. In one embodiment the umbilical is connected to the riser at first and second spaced apart connection points. The cable length extending between the connection points is larger than the distance therebetween such that the cable can be wrapped around the riser several times. Thereafter, the umbilical is fixed against the riser at the third connection point located between the first two points. The present invention provides a quick and cheap way of wrapping the umbilical around the flow line and allows for exchange of flow line parts or the umbilical without disassembling the complete flow line.
