Abstract (en)

[origin: WO9948615A1] According to the invention, different coloured and/or different types of flocks(8,9) are applied to cover or flock-coat profiled joints or other profiled sections (11) in predetermined areas in a coating station (3) at the very moment when the required holes and separating cuts are made in the cutting and drilling station (4). The flock cabin (10) is divided up in to partial cabins (15,17,19) by means of partitions (16,18) which can be displaced in a corresponding manner towards the profiled section (11) or brought tightly against it. Instead of the above-mentioned partitions (16,18) or in addition to the partitions (16,18), axially separating partitions (29,30) extending in a longitudinal direction of the profiled section (11) are provided. The inventive method enables various coating areas (35, 36, 37) to be obtained on one single profiled section. This makes it possible, for instance, to adapt precisely defined areas e.g. joint elements in a car body to the colour of the car or fittings.
