Abstract (en)
   [origin: WO9851508A1] An identification card processor (10) receives cards from a hopper (14), and passes them through a graphic imager (30) for
   printing, and either prior to printing or subsequently, the cards (57) are positioned on an index table (44) that permits moving the cards about an axis
   to different positions for further operations. The further operations take place at a station (52) set off from the plane of movement of the cards (57) in
   the graphics imager (30) to conserve space. The indexing table (44) is capable of being indexed to any desired rotational position in a full 360 DEG
   of movement, and for moving a card (57) under positive drive (32, 64, 68, 102) to and from the indexing table (44).
