Abstract (en)

[origin: FR2764306A1] The invention concerns an indirect genotypic method for diagnosing type 2 familial hemiplegic migraine in a person, characterised in that it consists in: isolating in said person's DNA the presence of a marker located on the 1a21-q23 chromosome in the locus limited by the D1S2343 and D1S2844 markers, said marker being related with the occurrence of familial hemiplegic migraine in his family.
