Abstract (en)

[origin: US6302492B1] A picking device used for separating a fill material. The picking device includes a magazine for holding the fill material. The magazine has a width defined by two movable lateral walls and a depth defined by a two-piece stationary bottom which has an upper surface for sustaining the fill material. The two pieces of the bottom are spaced apart so as to form a discharge slot for releasing the fill material from the magazine. The lateral walls are movable so that they swing relative to the stationary bottom within a swing range to facilitate discharge of the fill material through the slot.
