Abstract (en)
[origin: WO9852768A1] There is described a substrate for a planographic printing member having a surface roughness in the range 0.1 to 2 μm which comprises particulate material, especially alumina and titania and a binder for the particulate material which is preferably derived from a sodium silicate liquid. The substrate is suitable for preparing a planographic printing member having a resolution of 10 μm or less and/or dots having a roundness of less than 2 and/or an exposure latitude of greater than 1.2 and/or a broad dot range.
