Abstract (en)
[origin: GB2332367A] A finger toothbrush has a bristled body 2 with a side engaging a finger 14 and at least one generally loop-like element 3 for holding the brush on the finger. The body 2 has at least one aperture 5. An element 3 engages with at least one of those opposed boundary edges (6, Fig. 9, not shown) of an aperture 5 which extend along the toothbrush. The aperture(s) facilitate injection moulding of the brush and brush bending during use. Bristle shapes are described (Figs. 6 to 8), and brush dimensions, and the brush may have bristles and/or bristle bundles (Fig. 9). A rib (13, Fig. 2) to retain tooth powder may surround the bristles.
