Abstract (en)

[origin: EP0985617A1] The conveyor system has a belt (10) to take the flow of loose and limp products (12) in an overlapping configuration (S) from the transport system (14), for onwards movement. The conveyor belt (10) passes round a deflection drum (16), to form an advancement movement gap (26) between them to take the overlapping product structure (S), with an edge section over the drum on one side. The recirculating path (104) of the transport system (14) runs next to the drum, fitted with grips (20) to grasp the overlapped (S) materials at the edges for onwards movement.
