Abstract (en)
[origin: EP0986029A1] The multiple franking machines are controlled by the user from a supervisory terminal (60) connected directly to the public communication network (40). A postal authority management server (50) also connects to the public network, and responds to requests from the user's supervisory terminal by supplying an authorization code directly to the franking machine network (26) to validate subsequent franking operations.
