Abstract (en)
[origin: EP0987210A2] The folding blade drive has a first detection unit (60) with which the blade (10) reaching its top position transmits a first signal to the control unit. A second detection unit (58) is provided with which the blade reaching a bottom position transmits a second signal to a control unit (64) working in conjunction with the folding machine. The control unit switches off at the folding machine if the first or second signal is not given at a previously determined time.
