Abstract (en)  
[origin: EP0987493A1] The burner is designed so that downstream of the fuel injector at least one sensor (400) is arranged for determining a block-back of the flame (80) from the combustion chamber (30) in the inside of the burner, fuel regulation is activated. The fuel supply to the flame is reduced at least temporarily and the fuel amount to the pilot burner is increased simultaneously to maintain a constant turbine output.
