Abstract (en)
[origin: GB2326147A] Apparatus for use in wrapping an item in a tamper respondent laminate comprises: a body; a support (41) for an item (24) with a sheet of laminate adjacent (26) a face of the item and a flap (56, 57) of the laminate extending beyond an edge of the face; and a folding member (59) mounted on the body and being pivotable around an axis (61), the member defining a surface for engaging the flap of laminate. The support (41) positions the item (24) such that the edge (30, 32) of the face lies on the pivot axis (61), whereby pivoting of the folding member (59) folds the laminate flap around the pivot axis and around the edge. A second folding member (67) is pivotally connected to the first (59) so that subsequent folding of member (67) about pivot axis (65) folds a flap of the laminate over a further face of the item (24).
