Abstract (en)

[origin: WO9859516A1] In a mobile communication network including at least one mobile switching center and at least one mobile station, a method and system are provided for paging a mobile station. A list of cell-identifying information representing possible locations of the mobile station is established by making contact between the mobile switching center and the mobile station, determining a cell in which the mobile station is located, and adding information identifying the cell in which the mobile station is located to the list. The mobile station is selectively paged within each of the cells identified by information in the list until a response is received.
