Abstract (en)  
[origin: WO9916294A2] The display device is used to prevent goods in shops and at exhibitions. Substantial components include a supporting structure (9) e.g. a panel, in general a plurality of profiled bars (1,2,3) which are horizontally fixed to the supporting structure (9) and supporting arms (8) which can be hooked into the profiled bars (1,2,3). A supporting arm (8) is hooked into a profiled bar (1,2,3) in the following manner only: the free end of the bar part (80) is raised in relation to the horizontal, the chamfer is moved forward from the below the profiled bar (1,2,3) towards said bar (1,2,3) and the free end of the bar part (80) is finally lowered into a final position. The supporting arms (8) can be hooked up with different shaped bar parts (80) along the profiled bars (1,2,3) at will or in specific hanging positions. The supporting arms (8) can be used as direct supports for goods or the supporting arms (8) provide support for the actual goods support fixtures such as transversal bars fixed between said arms (8) or trays placed thereon. The goods support fixtures can be provided on several planes with different lengths and different angles of said bar parts (80). Other embodiments are provided as an alternative to the profiled bars (1,2,3). One variation involves several short profiled bar pieces arranged in columns and rows on both sides of the supporting structure (9). The device is characterised by its variability, multiple aesthetic design qualities and is easy to use.
