Abstract (en)

[origin: WO9900680A1] The present invention relates to a beam-splitting element (1) which is placed in the light beam (L) unlike traditional beam-splitting cubes. The light beam (L) penetrating into the beam-splitting element (1) through a refraction surface (10) will thus impinge on the partially transparent surface (11) at an incidence angle (β) of less than 45 DEG and preferably less than 22.5 DEG. This element is characterised by its polarisation neutrality and by the fact that it is not sensitive to temperature. The element of the present invention can be used advantageously in current transformers that include a retro-reflection device.
