Abstract (en)
[origin: WO9901964A1] A communication system is provided which can provide a broadband communications link into a number of homes and/or businesses. The communication system provides this broadband communications link by broadcasting the data using a network of radio nodes. The network of radio nodes is preferably arranged so that there are a plurality of independent data paths which can be used to transmit data through the network from a source node to a destination node. The radio nodes can communicate with each other using, for example, microwave or optical carrier signals.
