Abstract (en)
[origin: US6678659B1] A system of voice information diffusion through a packet-switching telecommunications network starting from a platform for an automatic voice teleservice system. The message diffused by the platform, can be listened to from a plurality of terminals. The messages are transmitted through the telecommunications network in coded form, the code including a semantic representation of messages, and then are converted into audio signals at a network access point of the packet switching telecommunications network. The network access points are distributed geographically and can generally be accessed by a local tariff call.
