Abstract (en)

[origin: EP0994326A2] The search head has a search device (14) mounted behind a window (12) that is transparent for the working radiation. The device responds to the working radiation from a target and produces target signals dependent on the position of the target in the field of view. There is an arrangement for determining a sighting line to the target and a cover (18) for protecting the window from thermal and mechanical loads, esp. for high speed flying craft. The cover has an opening and the sighting line can be tracked with this opening by a control arrangement.
