Abstract (en)
[origin: GB2327240A] A restraint system comprises a tie (20) for tying about a person to be restrained and a bracket (10) for fastening to a fixed object, adapted to engagably receive a part of the tie (20). The tie (20) includes a pawl (22) in a head aperture (26) for engaging serrations (23) on a strap (21) of the tie (20) when the strap (21) is passed through the head (26), the tie (20) having been looped about the person. The bracket (10) has a through passage (13) with a widened insertion opening (14) for receiving a projecting portion of the strap (21). Means (16) within the bracket (10) engage the strap (21), and an abutment surface of the tie (20) abuts the bracket (10), thereby causing the outlet of the head aperture (26) to be disposed at or adjacent the entry to the passage (13).
