Abstract (en)

[origin: WO9905794A2] According to the invention, interface module-specific alarm storage areas are set up in a database (DB) for the interface modules (SLM, TM) of a communications system. In the event of an at least partial breakdown of an interface module (SLM, TM), at least one connection unit (AL) connected to said interface module (SLM, TM) and/or at least one communications unit connected to the interface module (SLM, TM) by said connection unit (AL), an alarm identifying the interface module (SLM, TM) is triggered and displayed.
