Abstract (en)
[origin: US6279327B1] A flushing apparatus for drinking vessels and/or for vessels suitable for the storage of liquid, in particular for glasses, is described, and provides a space to receive at least one drinking vessel and/or at least one vessel suitable for the storage of liquid and includes a duct system, with which a cryotechnical medium can be supplied directly into the space for receiving drinking vessels. It is thus possible for the first time to cool drinking vessels down to a desired temperature, substantially independently of the predetermined drinking vessel temperature, in a very short time, and thus to insure the cooling, remaining uniform for a long period, of a drink which is subsequently poured in.
