Abstract (en)
[origin: EP099775A2] A multi layer, negative-working color photographic material in which at least 95 mol.% of the Ag halide is AgCl is such that at least one of the Ag halide emulsion layers shows solarisation on analog illumination (i.e. the color density decreases: (A) with increasing illumination intensity at constant illumination time; or (B) with increasing illumination time at constant illumination intensity). The material is one containing Ag halide emulsion layers which comprise at least one blue-sensitive layer containing a yellow coupler, at least one green-sensitive layer containing a magenta coupler and at least one red-sensitive layer containing a blue-green coupler.
